

Lab Task

1. Open a terminal and print the following output (use a single echo command):
Welcome to Linux
Linux is free, secure and open source
2. Create a directory named lab1 inside your home directory.
3. student1.txt, student2.txt, student3.txt
4. Write the text Linux makes life easier inside student1.txt using the echo command.
5. Display the contents of student1.txt on the terminal using the cat command.
6. Combine the contents of student1.txt and student2.txt into a new file named merged.txt using the cat command.
7. View only the first 2 lines of merged.txt using the head command.
8. View only the last line of merged.txt using the tail command.
9. Copy student1.txt into a new file named student1_copy.txt.
10. Rename student2.txt to studentB.txt.
11. Delete the file student3.txt.
12. Create a new directory backup inside lab1 and move student1_copy.txt into it.
13. Display the list of all files and directories in lab1 with detailed information (permissions, owner, size, date).
14. Display the last 5 commands you executed
15. Show the username of the currently logged-in user
16. Check your system's IP address using the ip addr command.
17. Display today's date and time using the date command.
18. Create an alias named mypath for the pwd command.
19. Run mypath and check if it displays your current working directory.
20. Remove (unalias) the alias mypath.

Bonus Task (Optional)

1. Run All The commands given in manual for better understanding of Linux commands
